

M.S. Ramaiah University of Applied Sciences – Faculty of Engineering & Technology (FET)

Portfolio Website

B. Tech. in AI/ML Engineering

Internship Work in

Department of Computer Science & Engineering

NAME: ANGEL BIJU

REG. NO. :25ETAI410016

**Instructor: Ms. Pooja Sri R
(Ramaiah Academy)**

JULY– 2026

Faculty of Engineering and Technology

M. S. Ramaiah University of applied sciences

Bengaluru -560 054

Faculty of Engineering and Technology

Certificate

*This is to certify that the Internship Work titled “**Portfolio**”, done at Ramaiah Academy Foundation, is a Bonafide record of the work carried out by **ANGEL BIJU**, **Reg. No. 25ETAI410016** in partial fulfilment of requirements for the award of B. Tech. Degree in AI/ML of M. S. Ramaiah University of Applied Sciences in the Department of Computer Science Engineering.*

JULY – 2026

Ms.Pooja Sri

Associate Application Engineer
Ramaiah Academy

Dr. T. N. Srikantha Dath

Director
Ramaiah Academy

Dr. C Narendra Babu

HOD, Department of Computer Science & Engineering

Declaration

The internship work is submitted in partial fulfilment of academic requirements for the B. Tech. Degree of M. S. Ramaiah University of Applied Sciences in the Department of Computer Science & Engineering. This internship work is a result of my own work and is in conformance to the guidelines as laid out in the University Student Handbook.

Sl. No.	Reg. No.	Student Name	Signature
1.	25ETAI410016	ANGEL BIJU	

JULY 2026

Acknowledgements

I take this opportunity to express my sincere gratitude and appreciation to **Ramaiah University of Applied Sciences**, Bengaluru for providing me an opportunity to carry out my internship work.

It brings a sense of privilege to associate this work with **Ramaiah Academy Foundation**. Working under them has been a precious opportunity. I am immensely thankful for trainer's **Ms. Pooja Sri R** for their constant encouragement, inspiring ideas and mentoring, which reflects in the final images of this work.

I am grateful to the University and thank **Dr. C Narendra Babu**, HOD of the Department of Computer Science & Engineering for providing me with this opportunity, guidance, and encouragement throughout.

I would like to earnestly thank **Dr. Sarat Kumar Maharana**, the Dean, FET, for and **Dr. B S Dayananda**, Associate Dean Academics, facilitating academic excellence in the college that helped in completing this project.

I would also like to earnestly thank **Prof. Kuldeep Kumar Raina**, the Vice Chancellor, for facilitating academic excellence in the college that helped in completing this project.

I am thankful to the management of Ramaiah University of Applied Sciences for providing all the facilities and resources for the successful completion of the course.

Finally, I thank my parents, friends and all my well-wishers who have supported me in this endeavor.

The values of dedication, discipline, work ethics and patience that I have imbibed here will always remain the guiding force throughout my life.

Abstract

Motivation: The motivation for the project was to create a professional digital identity while strengthening practical knowledge of frontend development. A portfolio provides a single platform to demonstrate technical abilities, completed projects, design skills, and continuous learning and as part of a resume.

Scope: The scope includes a responsive navigation bar, hero section, about section, skills section, project showcase, contact form, footer, theme switching and, interactive navigation. The implementation was developed incrementally by converting the existing static website into responsive webpage.

Methodology: The development process involved requirement identification, interface planning, component decomposition, React implementation, CSS styling, JavaScript-based interaction, responsive testing, debugging, and refinement. Vite was used as the React development and build environment.

Result: The completed implementation provides a responsive and visually consistent portfolio interface with React components such as Navbar, Hero, About, Skills, Projects, Contact, and Footer. Interactive features include a responsive navigation menu, dark/light theme support, dynamic greeting, project rendering, form validation, reusable button and color styles.

Conclusion: The project successfully demonstrates the practical application of modern frontend development concepts. It also provides a foundation for future enhancements such as backend-based contact handling, additional projects, improved accessibility, and deployment to a production hosting platform.

1.Introduction

1.1 Background

Personal portfolio websites have become an important medium for students and developers to present their technical abilities, projects, interests, and professional identity. Unlike a conventional resume, an interactive portfolio can demonstrate practical work through live interfaces, project descriptions, source-code links, and responsive design, demonstrating the person's knowledge of it.

1.2 Project Overview

The project is a responsive personal portfolio website developed for Angel Biju (myself). The interface presents an introduction in the hero section, an About section, technical skills, projects, a contact form, and social links. The webpage supports light/dark theme presentation.

1.3 Technologies Used

HTML – semantic structure and content organization in the original implementation.

CSS – responsive layouts, animations, component styling, hover effects, and theme styling.

JavaScript – dynamic greeting, theme switching, navigation interactions, validation, and project rendering.

Visual Studio Code – source-code editing and project development environment.

React – component-based implementation of the final portfolio interface.

Vite – development server and build tooling for the React application.

Git/GitHub – suitable version-control and source-code hosting workflow for the project.

Netlify – intended production deployment platform for the completed frontend application.

1.4 Objectives

- Develop a professional and responsive personal portfolio website.
- Convert a static HTML/CSS/JavaScript portfolio into a modifiable React application.

- Understand working of frontend architecture.
- Implement responsive navigation and mobile-friendly layouts.
- Implement light/dark theme switching.
- Present projects and technical skills clearly.
- Implement client-side contact form validation.
- Prepare the project for production deployment.

2. Literature Review

The development of a modern portfolio draws on established practices in responsive web design, component-based user-interface development, accessibility, and frontend performance. Responsive design principles emphasize flexible layouts that adapt to different screen sizes rather than maintaining a fixed desktop-only presentation.

Component-based frameworks such as React encourage developers to divide an interface into independent, reusable units. This approach is particularly suitable for portfolios because sections such as navigation, project cards, skills, contact forms, and footers can be maintained independently while sharing common styles.

Modern frontend tooling also emphasizes fast development feedback and optimized production builds. Vite provides a lightweight development environment and build process suitable for React applications. Consistent design tokens, reusable button classes, responsive breakpoints, semantic HTML, and accessible labels further improve maintainability and usability.

2.1 Design Principles Applied

Visual hierarchy through typography, spacing, contrast, and section headings.

Consistent primary and accent colours across buttons and interactive elements.

Responsive grid and flex layouts for desktop and mobile devices.

Clear navigation between major sections.

3. Problem Statement

Students and beginner developers often have difficulty presenting their technical learning and projects in a structured, professional, and visually appealing manner. A basic static web page can display information, but repeated markup becomes difficult to maintain as the portfolio grows. In addition, inconsistent styling and limited responsiveness can reduce the quality of the user experience.

3.1 Problem Definition

The problem addressed by this project is to design and implement a responsive, maintainable, and interactive personal portfolio that communicates the developer's skills and projects effectively while providing a foundation for future full-stack functionality.

3.2 Challenges Identified

Converting a static HTML structure into reusable React components.

Maintaining consistent styling across independent component CSS files.

Creating a navigation system that behaves differently on desktop and mobile screens.

Implementing light/dark theme switching without duplicating large amounts of CSS.

Validating contact-form input on the client side.

Keeping images and layouts visually balanced at different screen sizes.

4. Problem Solving / Methodology

4.1 Development Approach

The project was developed in increments. The existing HTML, CSS, and JavaScript implementation was first reviewed. The interface was then reused into React components, with each component responsible for a specific section of the portfolio.

4.2 Component Architecture

Navbar.jsx – responsive navigation and theme/menu controls.

Hero.jsx – introduction, profile image, greeting.

About.jsx – professional introduction and key areas of interest.

Skills.jsx – technical skills displayed.

Projects.jsx – project cards generated from project data using map().

Contact.jsx – contact form and client-side validation.

Footer.jsx – copyright information and social/contact links.

4.3 Styling Strategy

Each major component has its own CSS file for section-specific layout and appearance. Shared visual rules are centralized in a global stylesheet. CSS variables such as --primary and --accent are used to maintain a consistent colour palette majorly in the details of the buttons.

4.4 Interactive Features

Dynamic greeting based on the current time of day.

Light/dark theme toggle with 'localStorage' persistence.

Responsive mobile navigation controlled by a menu button.

Navigation menu closes after a mobile navigation link is selected.

Client-side validation for name, email, and message fields.

Dynamic copyright year in the footer.

4.5 Testing and Debugging

Testing focused on navigation behaviour, responsive layouts, button interactions, theme switching, image presentation, and contact-form validation. During debugging, attention was given to selector naming, class-name consistency, and JavaScript event handling. The React implementation also reduces repeated markup and makes future changes easier to isolate.

5. Results and Discussions

5.1 Final Interface

The final portfolio is organized into distinct sections with a clear visual hierarchy, each accessible from the Hero section. Each section serves its own purpose. The navigation bar is visible/stuck at the top the screen even when scrolled.

5.2 Responsiveness

The interface uses flexible grid and flexbox layouts with responsive breakpoints. On smaller screens, the navigation changes to a menu-based layout, hero content stacks vertically, project and skill cards adapt to available width, and contact controls remain readable.

5.3 Visual Consistency

A consistent visual system is maintained using a dark blue primary colour, orange accent colour, light background, and consistent button styling.

5.4 Functional Results

Navigation links connect to the relevant portfolio sections.

The hero section presents a dynamic greeting based on the time of the day.

The profile image is displayed in the hero section.

The About section presents professional information.

The theme toggle changes the visual presentation between light and dark and remembers the selected theme.

5.5 Limitations

The current contact form performs client-side validation but does not yet transmit submissions to a backend or email service.

The portfolio currently focuses primarily on frontend functionality.

6. Conclusions and Future Scope

6.1 Conclusion

The Portfolio Website project successfully demonstrates the transition from a static web interface to a structured React application. The implementation combines responsive CSS, JavaScript interactions, reusable React components, dynamic data rendering, theme switching, and client-side form validation. The project provided practical experience in organizing frontend code and applying modern web-development practices.

6.2 Learning Outcomes

Understanding React component structure and JSX.

Using props and arrays to support reusable interface elements.

Using map () to render dynamic content.

Separating component-specific CSS from shared global styles.

Understanding responsive web design using Flexbox, Grid, and media queries.

Implementing browser-side state such as theme preferences with localStorage.

Debugging JavaScript and UI behaviour using browser developer tools.

Preparing a Vite-based application for production deployment.

6.3 Future Scope

Connect the contact form to Emails, Netlify Forms, or a custom Node.js/Express backend.

Add a dedicated backend and database for storing contact submissions.

Add project filtering, project detail pages, and real GitHub/live-demo links.

Add downloadable resume/CV functionality.

Improve accessibility with keyboard navigation, ARIA refinement, and automated audits.

Add animations using a lightweight animation library where appropriate.

Add analytics to understand portfolio visitor behaviour while respecting privacy.

Deploy the final React/Vite build on Netlify and configure a custom domain if required.

Appendix A: Project Structure

The structure hierarchy of the some main components of the program as in the Vite react folder is as follows:

Each section of the website is coded in separate files, hence this helps to debug if any issues occur, or make changes to particular sections without affecting the code for rest of the webpage.

Public folder contains files that can be referenced in the any file in the parent folder.

Appendix B: Key Code Features

B.1 Shared Design Tokens

The public stylesheet defines common colours and button styles. For example, the primary blue and orange accent are stored as CSS custom properties and reused throughout the portfolio.

Any image or file in the public file can be linked through in any of the files.

B.2 Contact Form

The current contact form validates required fields and checks for a basic email format and a minimum message length. At present, successful validation produces interface feedback only; a backend service is required for actual message delivery and storage.
